HOWTO - Changes from Xailient .so libraries to Xailient .a libraries

The Xailient SDK has gone through some changes recently to simply linking and deployment by removing shared libraires and switching to static libraries. This simplifies deployment as now the Xailient executable doesn't need to be located in a specific directory relative to Xailient libraries.

An example Makefile may be available in the Xailient SDK archive to illustrate how to compile.

Also note that the programming interface in the new SDK is C++ rather than C. All the necessary headers are available in the include/ directory.
